

Announcing the IoT Network Certified™ Device Directory

CTIA Certification has launched a new IoT Network Certified certification program, a custom certification program for cellular-enabled Internet of Things (IoT) devices. If you have IoT devices that are PTCRB certified, these devices automatically qualify for IoT Network Certified status and can be co-listed on the certified device directory on the [IoT Network Certified website](#).

Why co-list your IoT devices?

- IoT device categories continue to expand at a rapid pace; procuring certified devices is important to meet demand for more connected solutions
- Promote your certification to potential customers visiting the website and searching for certified products
- Use the IoT Network Certified logo on your product collateral
- Download a certification certificate for each device to promote your certification

➔ **To get started**, log into the [PTCRB certification database](#) to see which PTCRB certified devices you have that qualify. You will find instructions on how to co-list your devices in the directory.

The IoT Network Certified website features case studies of certified IoT devices on the homepage. If you would like to provide a case study for any of your devices, describing the application and benefits of getting certified, please contact CTIA Certification at programs@ctiacertification.org.
